Introduction to Programming in R

Ivan G. Costa & Tiago Maie

Institute for Computational Genomics Joint Research Centre for Computational Biomedicine RWTH Aachen University, Germany

Slides and exercises are available online: https://www.costalab.org/bioinformatics-in-r-2020/

Daily Schedule:

9:30 - 12:00 - Theory and practices - **zoom**

13:00 - 17:00 - Mandatory and optional exercises available on webpage - **discord**

Important: M.Sc. and B.Sc. students need to send scripts with solutions for all mandatory exercises by the end of the day to courses@costalab.org

Programming, Language & Algorithms

What is an algorithm?

- finite set of well defined and unambiguous commands to solve a task.

Programming language

 vocabulary and set of instructions to command a computer

Algorithm Example - "Cake baking"

Prepare a cake pan by spraying with baking spray or buttering and lightly flouring. Next, combine flour, baking powder, baking soda, and salt in a large bowl and set the mix aside. Add 3 eggs, one at a time, and mix just until combined. Add flour mixture and buttermilk, alternately, beginning and ending with flour. Preheat oven to 200 C. Pour the dough in a pan and bake it for 25-30 minutes until edges turn loose from pan and toothpick inserted into middle of cake comes out clean. Remove from the oven and allow to cool for about 10 minutes.

Algorithm Analysis

Algorithm Example - "Cake baking"

 Prepare a cake pan by spraying with baking spray or buttering and lightly flouring. Next, combine flour, baking powder, baking soda, and salt in a large bowl and set the mix aside. Add 3 eggs, one at a time, and mix just until combined. Add flour mixture and buttermilk, alternately, beginning and ending with flour. Preheat oven to 350° F, pour the dough in a pan and bake it for 25-30 minutes until edges turn loose from pan and toothpick inserted into middle of cake comes out clean. Remove from the oven and allow to cool for about 10 minutes.

Task - back a cake Language - English

Well defined - ???

Algorithm Analysis

Algorithm Example - "Cake baking"

 Prepare a cake pan by spraying with baking spray or buttering and lightly flouring. Next, combine flour, baking powder, baking soda, and salt in a large bowl and set the mix aside. Add 3 eggs, one at a time, and mix just until combined. Add flour mixture and buttermilk, alternately, beginning and ending with flour. Preheat oven to 350° F, pour the dough in a pan and bake it for 25-30 minutes until edges turn loose from pan and toothpick inserted into middle of cake comes out clean. Remove from the oven and allow to cool for about 10 minutes.

Task - back a cake Language - English Exact - ??? Well defined - ???

Computer Language

- well defined commands.
- tests to decide the next steps (if-else command)
- tests for repeating commands until a condition is satisfied (while or repeat)

My first algorithm- "Cake baking"

1. If baking spray is available then

prepare cake pan by spraying

else

prepare pan by buttering and lightly flouring.

- 2. While mixture is not creamy
 - 1. Combine flour, baking powder, baking soda, and salt in a large bowl
- 3. Repeat 3 times
 - 1. Add an egg
 - 2. While mixture not homogeneous
 - 1. Mix dough.
- 4. Pour the dough in a pan.
- 5. Turn oven on.
- 6. Wait until temperature is 200 C.
- 7. Put pan into oven
- 8. While "not" edges turn loose from pan or 30 minutes have passed.
 - 1. Wait 1 minute.
- 9. Remove from the oven
- 10. Wait for 10 minutes.

1. Exercise:

1. Describe how to change a tire using "if" and "else" and while.

- Script based Programming language
- Focus of statistical data analysis
- Open source
- Contributing packages
 - Bioconductor (bioinformatics functions)
 - ggplot2 (plotting functions)

Computer Architecture

- Central Processing Unity (CPU)
 - execute mathematical operations
- Memory (RAM)
 - stores (limited) data for CPU (4-32 Gigabytes)
 - fast access but not permanent
- Permanent Storage
 - Slow access / large capacity (1.000 Gigabytes)
 - Permanent storage of files
- Input/output
 - monitor/keyboard/network card

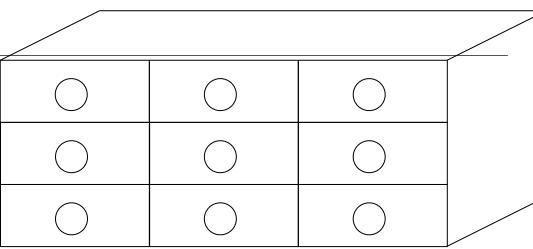

- A **computer memory** is like a large cabinet
- Each drawer can be used to keep information
 - i.e. names, telephones
- Each drawer holds a particular type of information
 - i.e. strings, numbers
- Computer knows the location of a particular drawer

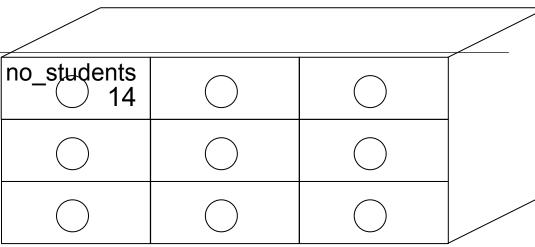

- Each drawer is called a variable (and we can give it a name)
- Each drawer has a type

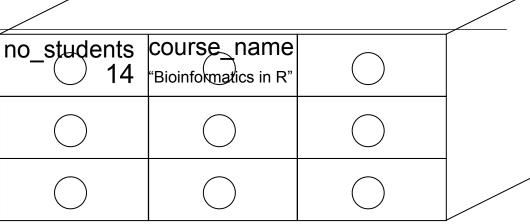

Each drawer is called a variable (and we can give it a name)

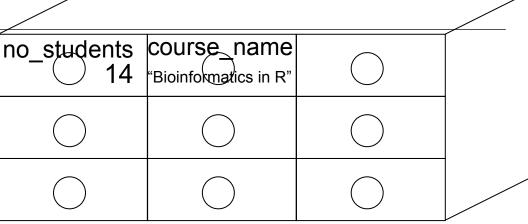

- Each drawer has a type

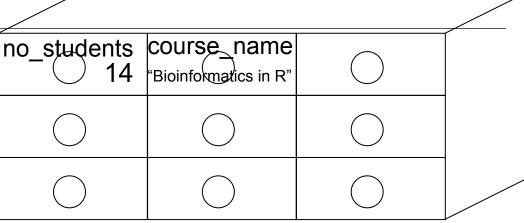

- Each drawer has a **type**
- In R, we have the following types:
 - **numeric:** no_students = 14

- Each drawer has a type
- In R, we have the following types:
 - **numeric:** no_students = 14
 - character: course_name = "Bioinformatics in R"

- Each drawer has a type
- In R, we have the following types:
 - numeric: no_students = 14
 - character: course_name = "Bioinformatics in R"
 - **boolean:** graduate_level = True

- Each drawer has a **type**
- In R, we have the following types:
 - numeric: no_students = 14
 - character: course_name = "Bioinformatics in R"
 - boolean: graduate_level = True
 - vectors: (combination of several variables of same type): instructors = c("Ivan", "Tiago", "Fabio")
 - Matrices: ...

Variables and Operations

We can apply arithmetic functions to variables

R console

| > x = 3 |
|----------|
| > y = 4 |
| > x + y |
| [1] 7 |
| > x*y |
| [1] 12 |
| > x/y |
| [1] 0.75 |
| |

| Operator | Description |
|----------|----------------|
| + | addition |
| - | subtraction |
| * | multiplication |
| / | division |
| ^ or ** | exponentiation |

Variables and Operations

We can apply arithmetic functions to variables

R console

> x = 3
> y = 4
> x + y
[1] 7
> x*y
[1] 12
> x/y
[1] 0.75

Variables and Operations

We can apply logical functions to variables & (and) and | (or) Operator Des

R console

| > x | = 3 |
|-----|-----------|
| > y | = 4 |
| > x | > y |
| [1] | FALSE |
| > z | = TRUE |
| > z | & (x > y) |
| [1] | FALSE |
| > z | (x > y) |
| [1] | TRUE |
| | |

| Operator | Description |
|-----------|--------------------------|
| < | less than |
| <= | less than or equal to |
| > | greater than |
| >= | greater than or equal to |
| == | exactly equal to |
| != | not equal to |
| !x | Not x |
| x y | x OR y |
| х & у | x AND y |
| isTRUE(x) | test if X is TRUE |

Overview of RStudio

Intro to RStudio

- RStudio is not R itself, but an integrated development environment (IDE).
- It offers several panels for different purposes, such as console, help message, plots, history, scripts... etc.

R version 3.5.1 (2018-07-02) -- "Feather Spray" Copyright (C) 2018 The R Foundation for Statistical Computing Platform: x86_64-apple-darwin15.6.0 (64-bit)

R is free software and comes with ABSOLUTELY NO WARRANTY. You are welcome to redistribute it under certain conditions. Type 'license()' or 'licence()' for distribution details.

Natural language support but running in an English locale

R is a collaborative project with many contributors. Type 'contributors()' for more information and 'citation()' on how to cite R or R packages in publications.

Type 'demo()' for some demos, 'help()' for on-line help, or 'help.start()' for an HTML browser interface to help. Type 'q()' to quit R.

RStudio - Organisation

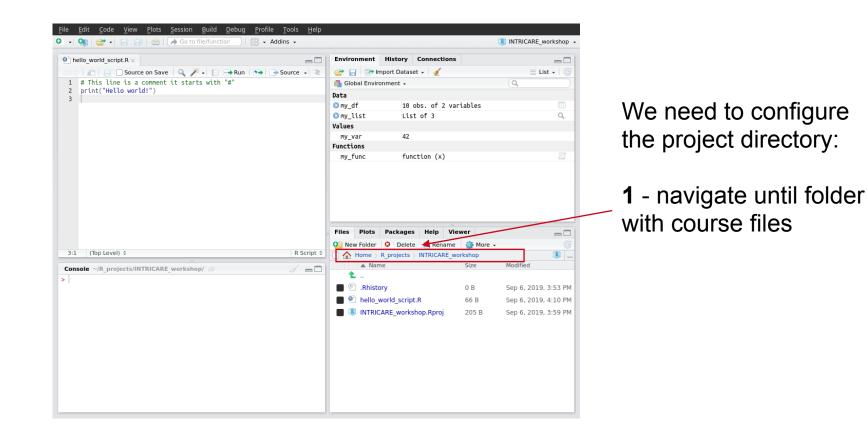

RStudio - Configure Project Directory

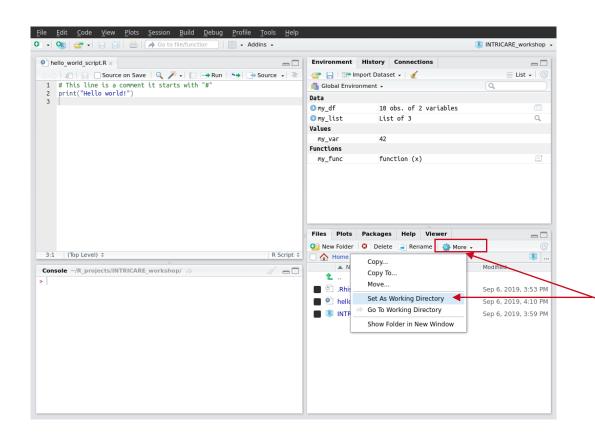

We need to configure the project directory:

RStudio - Configure Project Directory

RStudio - Configure Project Directory

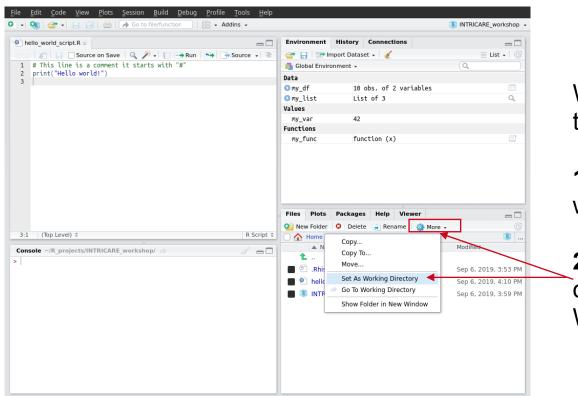

We need to configure the project directory:

1 - navigate until folder with course files

2 - select the "More" option and "Set as Working Directory"

RStudio - Configure Project Directory

We need to configure the project directory:

1 - navigate until folder with course files

2 - select the "More" option and "Set as Working Directory"

Now R Studio knows where to find files !

- Use arithmetic operations to perform the following calculations
 - 1 plus 3
 - 3 minus 1
 - 2 multiplied by 2
 - 4 divided by 2
 - 3 to the power of 2

OperatorDescription+addition-subtraction*multiplication/division* or **exponentiation

- Repeat the exercise but this time "save" the results of the operations (using variables)

- Use variables to store the amount of fruits in a shop.
 We have 5 green apples, 4 red apples, 10 bananas and 4 melons.
- Write a code using variables to answer the following questions:
 - How many fruits are there is total?
 - How many apples?
 - What is the average number of fruits per type?

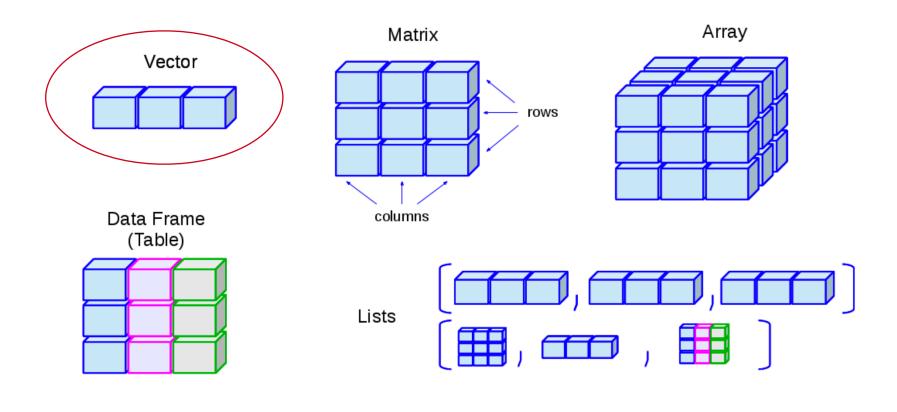

- An apple costs 0.5 cents, a banana 1.0 euro, a melon
 - 3 euros (use variables to store these!).
 - How much does it cost to buy all the apples in the shop?
 - How much does it cost to buy all the fruits in the shop?
- There was an additional shipment of fruits with 20 additional bananas and 10 additional red apples.
 - Estimate the cost of buying all apples or fruits in the shop after the new shipment.

- Use logical variables to answer the following questions.
 - Is buying all bananas cheaper than buying all apples?
 - You have 20 euros. Can you buy all apples?

Complex Data Structures

- Vector variable containing a array of items of the same type
- Lists a vector where items can have distinct types (tomorrow!)
- Matrix two dimensional vector with items of the same type
- Data Frame complex data structure for two dimensional data where columns can be of distinct type (as an excel sheet) (tomorrow!)

Complex Data Structures

Vector

Creating, accessing and updating vector

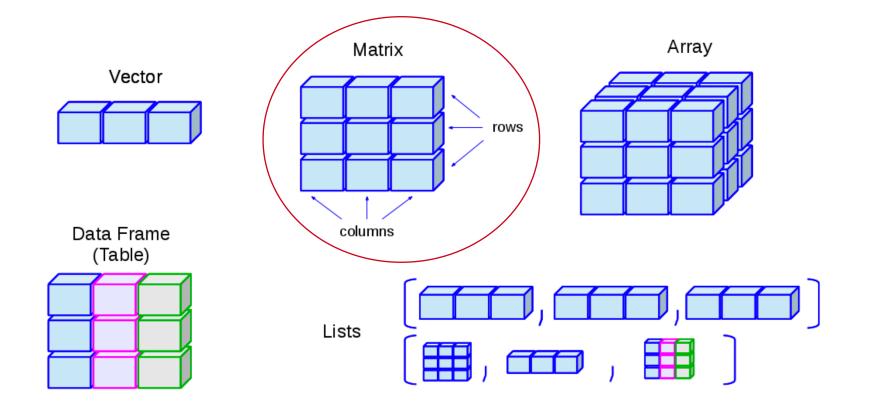

```
> v = c(3.2, 4.1, 1.9)
> v
[1] 3.2 4.1 1.9
> v[2] # access 2<sup>nd</sup> position of vector
[1] 4.1
> v[3] = 10.4 #update 3<sup>rd</sup> position of vector
> v
3.2 4.1 10.4
> u = c(1, 2, 3)
> z = u + v #sum 2 vectors (if size is the same)
> z
[1] 4.2 6.1 13.4
```

Vector

Operations, functions and access

```
> length(z) # function indicating size of vector
[1] 3
> 1:2 # vector with 1 and 2.
[1] 1 2
> z[1:2] #subsetting vector (1st and 2rd pos.)
[1] 4.2 6.1
> z > 6 #logical operator
[1] FALSE TRUE TRUE
> z[z > 6] # return all values greater than 6
[1] 6.1 13.4
```

Complex Data Structures

Matrix – two dimensional vector / same type

```
> m = matrix(1:12, 4, 3) \# 4 by 3 matrix
                        # size of matrix
> dim(m)
4 3
> m[1,]  # show first row of matrix
[1] 1 5 9
> m[3,1] #show element at 3<sup>rd</sup> row / 1<sup>st</sup> column
[3]
> m
     [,1] [,2] [,3]
[1,] 1 5
                  9
[2,] 2 6 10
[3,] 3 7 11
    4 8 12
[4,]
```

Matrix – two dimensional vector / same type

```
> v1 = c(10, 4, 10) \# a vector with 3 entries
> v2 = c(4,10,2) # another 3 entry vector
> mat = rbind(v1,v2) # join two vectors as a matrix
> mat
  [,1] [,2] [,3]
v1 10 4 10
v2 4 10 2
```

• RStudio also helps visualisation of a matrix

• What happens if we have a large matrix? 450.000 lines by 1000 samples?

• What happens if we have a large matrix? 450.000 lines by 1000 samples?

```
> m = matrix(1:12, 450000, 1000) # 4 by 3 matrix
> dim(m)  # size of matrix
[1] 450000 1000
> m[,1]  # show first column of matrix
[1] 1 2 3 4 5 6 ...
```

• Large matrices use a lot of memory (1.7 GB)!

> remove(m) # remove m from memory

Functions

Functions

- A section of a program that perform a specific task
 - Takes values as input parameter and returns some new value (or performs an operation)
- R defines several types of functions
 - math: log, exp, abs, sqrt, min, max, ...
 - array/matrix manipulation: length, dim, array, rep, ...
 - Read/write files: read.table, write.table, ...
- Can be created by user or defined in contributing packages (tomorrow!)

Example of Functions

```
> log2(4)
[1] 2
> m = matrix(1:12, 4, 3) \# create a matrix
> dim(m)  # size of the data frame
[1] 4 3
> summary(m) # statistics of the matrix columns

# write matrix in a .txt file
> getwd()  # current working directory
```

Functions and help

> help.start() #opens a page with manual, tutorials and help search

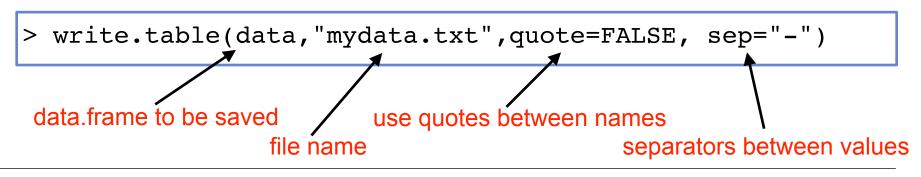

> help("write.table") #show options for write.table

```
write.table {utils}
                                                                                                                                                            R Documentation
Data Output
Description
write.table prints its required argument x (after converting it to a data frame if it is not one nor a matrix) to a file or connection.
Usage
write.table(x, file = "", append = FALSE, quote = TRUE, sep = " ",
              eol = "\n", na = "NA", dec = ".", row.names = TRUE,
              col.names = TRUE, qmethod = c("escape", "double"),
              fileEncoding = "")
write.csv(...)
write.csv2(...)
Arguments
                 the object to be written, preferably a matrix or data frame. If not, it is attempted to coerce x to a data frame.
х
                 either a character string naming a file or a connection open for writing. " " indicates output to the console.
file
                 logical. Only relevant if file is a character string. If TRUE, the output is appended to the file. If FALSE, any existing file of the name is destroyed.
 append
                 a logical value (TRUE or FALSE) or a numeric vector, its elements are taken as
quote
                 the indices of columns to quote. In both cases, row and column names are quoted if they are written. If FALSE, nothing is quoted.
                 the field separator string. Values within each row of x are separated by this string.
 sep
```

Functions / Multiple Parameters

>help.start() #opens a page with manual, tutorials and help search >help("write.table") #show options for write.table

Libraries

- In R the primary mechanism for distributing software (functions) is via packages
- CRAN is the major repository for packages.
 - > install.packages("packagename") # install a new package
- Bioinformatic packages are available at Bioconductor package.
 - > install.packages("BiocManager")
 - > BiocManager::install(c("packagename")
- Before using functions of a library they need to be opened.
 - > library("packagename")

- Define a vector to store the amount of fruits and another one to store their prices.
 - There are 5 green apples, 14 red apples, 30 bananas and 4 melons
 - An apple costs 0.5 cents, a banana 1.0 euro, a melon
 3 euros
- Use vector operations/functions to calculate what is:
- The total amount of apples?
- The total amount of fruits?
- The total number of fruit types?
- The total price of all fruits?
- The maximum amount of any fruit?

- Use logical operators to answer the following questions.
 - Which fruit types have more than 5 units?
 - Which fruit types you can buy all items with 10 euros?
 - Which fruit type has the least amount of units?
 - Which fruit types cost less than the average fruit cost?

- Creating regular numeric sequences is a common task in statistical computing. You can use the seq function to create sequences.
- 1. Read the help page for seq by entering help(seq).
- 2. Generate a decreasing sequence from 50 to 1, then another sequence from 1 to 50.
- 3. Use seq to generate a sequence of the even integers between one and ten.

- Create an integer vector i that can be used to subset v such that it will output the elements of v in decreasing order. For the general case, read the help pages for **order** and **sort**.
 - > v = c(1.1, 2, 100, 50, 60)
