## **Bioinformatics Analysis in R**

## Advanced Gene Expression: Analysis of Cancer Genome Atlas

Ivan G. Costa, Martin Grasshoff

Institute for Computational Genomics RWTH University Hospital www.costalab.org

- 1. Obtain data from cancer patients from TCGA
- 2. Pre-process and analysis of RNA-seq data
- 3. Use machine learning to build a classifier for personalised medicine
- 4. Use interesting markers for survival analysis

### **The Cancer Genome Atlas**

- TCGA is a NCI (US) funded project to generate cohorts of cancers:
  - -Currently 33 cancers with 80-780 patients
- Comprehensive data from tissues:
  - Histology, clinical, gene expression profiling, copy number variation, DNA methylation using arrays or sequencing
- Data is publicly available upon generation and deposited in a portal (<u>portal.gdc.cancer.gov</u>)

#### **The Cancer Genome Atlas - Portal**

Single end

Paired end Ins: 200-800 bp

![](_page_13_Picture_4.jpeg)

![](_page_14_Figure_1.jpeg)

![](_page_14_Picture_3.jpeg)

#### Alignment

- a large reference sequence is given (genome)
  - up to billions of base pairs
- short reads (<200bps)

- find most probable position of the read in the genome (by inexact string matching)

![](_page_15_Figure_5.jpeg)

![](_page_15_Picture_6.jpeg)

#### Alignment - Split Read Mapping (RNA-Seq)

![](_page_16_Figure_1.jpeg)

#### Processed mRNA

![](_page_16_Picture_3.jpeg)

#### Alignment - Split Read Mapping (RNA-Seq)

![](_page_17_Figure_1.jpeg)

- reads are split between exons when mapped to genome
- aligners use transcript information or try to find splice events (STAR & TOPHAT)

![](_page_17_Picture_4.jpeg)

#### **Reference based aligners - Overview**

	Time	Precision	Pairs	GAPs	Phred	Memory	Application (Comments)
BOWTIE	+		+	-	-	5GB	General (max. 3 missmatches)
BWA	+		+	+	+	8GB	General (max of 200bps reads)
NOVOALIGN		+	+	+	+	8GB	General
							(commercial license)
STAR	+		+	-	+	32GB	RNA-Seq (allow split-maps)
BISMARK	+		+	+	+	10GB	Bisulfite/reduced
							sequencing

Computers need large memory and a few hours of computation per experiment!

#### **Quantification (Count Matrix)**

![](_page_19_Figure_1.jpeg)

#### **Simple Counting Approaches**

Gene Level - 17 reads Exon level - exon 1 (8 reads), exon 2 (3 reads), exon 3 (6 reads) Transcript Level - Exons 1,2 & 3 (10 reads) and exon 1 & 3 (7 reads) \* \* complex computational methods required (RSe, or TopHAT needed for this)

#### Fragments per Kilobase (FPKM)

- normalize counts by read size (kb) and RNA-seq library size (mb)

![](_page_19_Picture_7.jpeg)

#### **RNA-seq and Differential Analysis**

#### Arrays and RNA-seq have distinct distributions

![](_page_20_Figure_2.jpeg)

VOOM analysis is necessary to make variance similar to arrays.

![](_page_21_Figure_1.jpeg)

Diagnosis and treatment choices is mostly carried on macromolecular features:

- morphology of tumours (image), symptoms, blood levels

Challenges: use molecular markers (expression or genetics) for diagnosis or treatment selection.

![](_page_22_Picture_4.jpeg)

### **Machine Learning - Classifier**

![](_page_23_Figure_1.jpeg)

#### Data

- Expression matrix X (genes vs samples)
- classification vector *Y* (diagnosis)
- Find a function:

 $f(x) \to y$ 

![](_page_23_Picture_7.jpeg)

### **Machine Learning - Classifier**

![](_page_24_Figure_1.jpeg)

#### Data

- Expression matrix X (genes vs samples)
- classification vector *Y* (diagnosis)
- Find a function:

$$f(x) \to y$$

For new patients X':

 $\mathsf{f}(x') \to y'$ 

![](_page_24_Picture_9.jpeg)

### **Linear Classifier**

![](_page_25_Figure_1.jpeg)

Linear Function:

- $f(x, A) = a_0 + a_1 x_1 + \dots + a_L x_L$
- $f(x, A) > 0 \Rightarrow$  class A

 $f(x, A) \le 0 \Rightarrow$  class B

- Works for 2 classes only
  - Train a function for each cancer type
- Find coefficients *A*

Institute for

Computational Genomic

 estimated with neural networks or support vector machines

### **Linear Classifier - Problems**

![](_page_26_Figure_1.jpeg)

- Most real world problems are not linearly separable!
- There will be always some error!
- Solution: non-linear functions

![](_page_26_Picture_5.jpeg)

#### **Nonlinear Classifier - Problems**

![](_page_27_Figure_1.jpeg)

Polinomial Function  $f(x, A) = a + a + x^3 + a + a + x^3$ 

$$f(x, A) = a_0 + a_{11} x_1^3 + \dots + a_{L1} x_L^3$$

$$a_{12}x_{1}^{2}+...+a_{L2}x_{L}^{2}$$

$$a_{12}x_1 + \dots + a_{L2}x_L$$

- Third order polynomial
  - Problem: overfitting

![](_page_27_Picture_8.jpeg)

#### **Nonlinear Classifier - Problems**

![](_page_28_Figure_1.jpeg)

Polinomial Function

$$f(x, A) = a_0 + a_{11} x_1^3 + \dots + a_{L1} x_L^3$$

$$a_{12}x_{1}^{2}+...+a_{L2}x_{L}^{2}$$

$$a_{12}x_1 + \dots + a_{L2}x_L$$

Third order polynomial Problem: overfitting

![](_page_28_Picture_7.jpeg)

#### **Nonlinear Classifier - Problems**

![](_page_29_Figure_1.jpeg)

Polinomial Function

$$f(x, A) = a_0 + a_{11} x_1^3 + \dots + a_{L1} x_L^3$$

$$a_{12}x_{1}^{2}+...+a_{L2}x_{L}^{2}$$

$$a_{12}x_1 + \dots + a_{L2}x_L$$

Third order polynomial Problem: overfitting

![](_page_29_Picture_7.jpeg)

### Size of a Euclidean space grows with dimension (number of genes) Dots (patients) are sparsely distributed in space

![](_page_30_Picture_2.jpeg)

![](_page_31_Figure_1.jpeg)

Sparse data

- three genes
- 2 patients with known cancer (red vs yellow)
- 1 unknown (green)

![](_page_31_Picture_6.jpeg)

![](_page_32_Figure_1.jpeg)

- Sparse data
  - three genes
  - 2 patients with known cancer (red vs yellow)
  - 1 unknown (green)

Perfect classifier (on training)

![](_page_32_Picture_7.jpeg)

![](_page_33_Figure_1.jpeg)

- Sparse data
  - three genes
  - 2 patients with known cancer (red vs yellow)
  - 1 unknown (green)

Both are perfect classifiers (on training) Hard to generalise!

![](_page_33_Picture_7.jpeg)

![](_page_34_Figure_1.jpeg)

- There are millions of perfect linear classifiers
- And even more nonlinear classifiers!

![](_page_34_Picture_4.jpeg)

### **Dealing with Curse of Dimensionality**

- Have a proper training / test evaluation procedure
- Use classifiers which are as simple as possible
- Reduce the dimension of your data (feature selection or PCA)

![](_page_35_Picture_4.jpeg)

Measures for a two class problem (cancer + vs. non-cancer - )

![](_page_36_Figure_2.jpeg)

Source: Lever et al., Nat. Methods (2016)

![](_page_36_Picture_5.jpeg)

Measures for a two class problem (cancer + vs. non-cancer - )

![](_page_37_Figure_2.jpeg)

Source: Lever et al., Nat. Methods (2016)

### **Classifier Evaluation**

- The performance of your classifier needs to be evaluated on your test data:
  - an independent "validation cohort"
  - or retain a set of samples (1/3) that has similar distribution of classes of your total data

![](_page_38_Figure_4.jpeg)

![](_page_38_Picture_5.jpeg)

### **Classifier Evaluation**

- The performance of your classifier needs to be evaluated on your test data:
  - an independent "validation cohort"
  - or retain a set of samples (1/3) that has similar distribution of classes of your total data

![](_page_39_Figure_4.jpeg)

- Never use test data to improve classification (choose a better classifier or marker gene)
  - For this you need to establish validation data (or cross validation)

#### **Cross-validation**

![](_page_40_Figure_1.jpeg)

![](_page_40_Picture_2.jpeg)

#### **Elastic Net**

#### Is based on a linear function:

$$f(x, A) = a_0 + a_1 x_1 + \dots + a_L x_L$$

 $f(x, A) > 0 \Rightarrow$  classe A

 $f(x,A) \leq 0 \Rightarrow \text{classe B}$ 

• Find coefficients *A*, while most of then have 0.

- A shrinkage factor  $(\lambda)$  controls the number of genes selected.
- Shrinkage factor can be automatically identified with cross-validation.

![](_page_41_Picture_8.jpeg)

# Hands on!

![](_page_42_Picture_2.jpeg)

#### **Exercise (after the handout)**

You should perform clustering of tissues with liver cancer. Tip: use code similar to the one seen in gene expression data (day 3). Since, we are interested in grouping patients, you can transpose the matrix with the function **t**.

- 1. Can you see nice clusters in the dendrogram?
- 2. What about genes associated to each group? Are they associated to some particular biological function? Use differential expression analysis and GO enrichment analysis to solve this task.

![](_page_44_Picture_0.jpeg)

www.costalab.org

![](_page_44_Picture_3.jpeg)

Can be used to evaluate if characteristics of a patients indicates an increase/decrease risk of survival

- clinical: tumour type, gender
- Molecular: expression of a gene, mutation

Common Survival Tests:

- Cox proportional hazards regression (not seen here)
  - Compares survival with a numeric variable
- Kaplan-Meier graph / Log-rank test
  - compares the survival of groups of individuals

![](_page_45_Picture_9.jpeg)

### Kaplan-Meier graph / Log-rank test

#### Data:

- Event: death / alive
- Time: period between first and last observation.
- Characteristics: sex, tumor grade

Patient	Status	Time	Sex
1	Dead	343	Male
2	Alive	20	Male
3	Alive	300	Female
4	Dead	200	Male

![](_page_46_Picture_6.jpeg)

#### Survival of LIHC patients - male vs. Female

![](_page_47_Figure_2.jpeg)

#### Survival of LIHC patients - male vs. Female

![](_page_48_Figure_2.jpeg)

#### Log-rank test

#### Is the survival difference significant?

![](_page_49_Figure_2.jpeg)

![](_page_49_Picture_3.jpeg)

#### Log-rank test

#### Is the survival difference significant?

![](_page_50_Figure_2.jpeg)

![](_page_50_Picture_3.jpeg)

### **Kaplan-Meier plot**

![](_page_51_Figure_1.jpeg)

### **Kaplan-Meier plot**

![](_page_52_Figure_1.jpeg)

#### Kaplan-Meier / Log-Rank Test

#### KM and LRT can compare several groups at a time.

![](_page_53_Figure_2.jpeg)

#### **Survival Analysis and Biological Markers**

How to perform survival analysis on biological markers?

- 1. Given their continuous nature of gene expression, Cox hazards test is recommended.
- 2. An alternative is to group patients by expression of a gene (low/high expression) and use Kaplan-Meyer plots (seen in practical).

Important: if you test several markers you need to correct for multiple testing!!!

# Hands on!

![](_page_55_Picture_2.jpeg)

#### **Exercise (after the handout)**

You should perform clustering of tissues with liver cancer. Tip: use code similar to the one seen in gene expression data (day 3). Since, we are interested in grouping patients, you can transpose the matrix with the function **t**.

- 1. Can you see nice clusters in the dendrogram?
- 2. What about genes associated to each group? Are they associated to some particular biological function? Use differential expression analysis and GO enrichment analysis to solve this task.
- 3. Check if group of patients are associated to survival, tumour grade or any other clinical variable? You can use the table function for some of these analysis.
